Two perlite deposits on private land, 218 km from the United States

Perlite is not a concessible mineral under Mexican law: there is no mining concession in the way and no third party holds rights over the material. The ranch is owned by a single family.

2	5.2 Mt	80.7 Mt	218 km	21–45 kg/m³
Deposits on the same property	Estimated volume, not certified	Estimated resources, not certified	To the Agua Prieta border	Expanded density

LOCATION AND LOGISTICS

Close to the world's largest consumer

DESTINATION	DISTANCE	ROUTE
Agua Prieta – Douglas, AZ	218 km	Highway
Hermosillo, Sonora	267 km	Intermodal rail link
Cd. Juárez – El Paso, TX	367 km	Rail freight hub
Port of Guaymas	429 km	Maritime outlet

THE MARKET

The United States does not produce enough perlite to meet its domestic demand: it imports a quarter of its consumption

This is the figure that explains why the project exists. The United States is the world's fourth-largest producer and runs a permanent shortfall: **around 23 % of the perlite it consumes is bought abroad, and 94 % of those purchases cross the Atlantic from Greece.** The average price rose from 64 to 78 dollars per tonne between 2021 and 2025.

U.S. Geological Survey, Mineral Commodity Summaries 2026, Perlite chapter.

WATER AND RIGHTS

Flowing water year-round inside the property

A **perennial spring-fed arroyo** crosses the ranch twelve months a year. It is not a seasonal wash: the canyon keeps pools and riparian vegetation all year round. In the Opata language, *babi danchi* is the place where the water runs.

The legal standing is confirmed in writing by the Ministry of Economy in official letter 146.8/2016-4851: **perlite is not subject to the Mining Law** and belongs to the owner of the land.

VOLUMES AND RESOURCES

5.2 Mt estimated; 80.7 Mt of resources

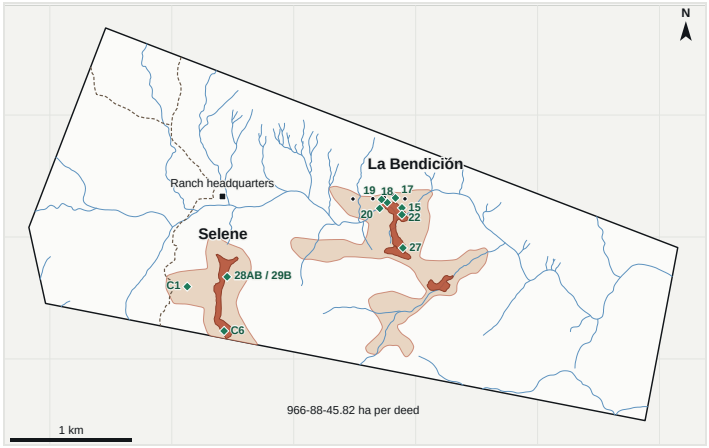

Two independent studies: Consultoría Geológica GV delimited 1,244,784 m³ (2,863,005 t), which its report calls "proven reserves", and Vidal Solano and Hinojosa García estimated 2,337,628 t at surface. **It excludes 926,398 m³ of GV's "probable reserves".** The geological resources come from the thesis by Almazán Holguín and Trelles Monge (1986). None of these figures is certified; no NI 43-101 or JORC report exists yet.

THE RESOURCE

Two deposits from the same perlitic dome

Both deposits formed in a single volcanic event from two separate emission points. They lie about one kilometre apart, on the same ranch, and the evidence points to a single dome with several surface outlets.

Selene, to the south: sampled and analysed. **La Bendición**, to the north: drilled across 3.5 hectares and mapped in detail.

Boundary: deed; layers: mapping; samples: laboratory. UTM 12N.

ORE QUALITY

Tested at the New Mexico Bureau of Geology

Eleven samples from both deposits, expanded at 704 °C with no preheating, recreating industrial furnace conditions.

PARAMETER	RESULT
Apparent expansion index	20 – 43 ×
Expanded density	1.34 – 2.79 lb/ft³
Furnace yield	84 – 93 %
Sinks (unexpanded)	from 0.67 %
Loss on ignition	4 – 6 %

> Sample PB16-29B recorded 1.34 lb/ft³ and only 0.67 % sinks: **better results than the Socorro perlite the laboratory itself uses as its reference standard.**
>
> Vidal Solano and Hinojosa García (2016), Tables 3 and 4. Testing: New Mexico Bureau of Geology & Mineral Resources.

WHAT WE ARE LOOKING FOR

The asset is ready. Capital is not.

Three structures fit the project as it stands today.

01
Sale of the mine
The family sells the complete project to a buyer who develops and operates it.

02
Sale of an equity stake
The family sells a percentage of the shares to an investor and keeps the rest.

03
Partnership with an investor
The partner brings capital; the family brings the asset and keeps equity, a board seat and financial reporting.
